Emergency Triage Assessment and Treatment (ETAT)

World Health Organization

Dr Stephen v Rensburg
Witbank Hospital
Feb 2012
Introduction

- Many deaths in hospital occur within 24 hours of admission.
- Some of these deaths can be prevented if very sick children are quickly identified on their arrival and treatment is started without delay.
- In many hospitals children are not checked before a senior health worker examines them; as a result, some seriously ill patients have to wait a very long time before they are seen and treated.
Triage

Sorting of patients into priority groups according to their need and the resources available

Triage is the process of rapidly examining all sick children when they first arrive in hospital in order to place them in one of the following categories …
TRIAGE

Emergency signs

Start emergency treatment

Priority signs

Rapid assessment and attention

Wait your turn
Who should triage?

- All clinical staff involved in the care of sick children
- If possible, all such staff should be able to give initial emergency treatment
- In addition, people such as gatemen, record clerks, cleaners, janitors who have early patient contact should be trained in triage for emergency signs and should know where to send people for immediate management
The ABCD concept
The ABCD concept

A  ▶ Airway

B  ▶ Breathing

C₁ ▶ Circulation
C₂ ▶ Coma
C₃ ▶ Convulsion

D  ▶ Dehydration (severe)
**Airway and Breathing**

A
- Not breathing
- Central cyanosis
- Severe respiratory distress:
  - Very fast breathing
  - Severe lower chest wall indrawing
  - Use of auxiliary muscles
  - Head nodding
  - Inability to feed

B
- If **yes**, is the breathing obstructed?

- Check for head / neck trauma before treating the child
Circulation

- Cold hand with:
  - Capillary refill longer than 3 seconds, and
  - Weak and fast pulse

- Check for severe malnutrition
Coma and Convulsion

- Coma or
- Convulsing (now)

**AVPU scale:**

- **A** – Alert
- **V** – Responding to Voice
- **P** – Responding to Pain
- **U** – Unresponsive / Unconscious
Dehydration (severe)

- Diarrhoea plus any two of these:
  - Lethargy
  - Sunken eyes
  - Very slow skin pinch
If the child has any sign of the ABCD, it means the child has an emergency “E” sign and emergency treatment should start immediately.
Priority signs

3TPR MOB
Priority signs

- Tiny baby: < 2 months
- Temperature
- Trauma or other surgical condition
- Pallor (severe)
- Poisoning
- Pain (severe)
- Respiratory distress
- Restless, continuously irritable or lethargic
- Referral (urgent)
- Malnutrition
- Oedema of both feet
- Burns
Priority signs

If the child has any priority “P” signs, it means the child should be put at the front of the queue to be rapidly assessed and treated without delay.
Queue (non-urgent)

If a child has no emergency or priority signs, it means the child can wait his/her turn in the queue for assessment and treatment.
THE END

Thanx
